Enterprise Interoperability

New Challenges and Approaches

- Keeps the reader up to date with developments in a field which is extremely important for industrial competitiveness
- International author pool means that readers can learn about the environment in many countries with which they may have to co-operate
- Inter-disciplinary subject matter allows the reader to learn about many points of view on similar problems

Interoperability: the ability of a system or a product to work with other systems or products without special effort from the user is a key issue in manufacturing and industrial enterprise generally. It is fundamental to the production of goods and services quickly and at low cost at the same time as maintaining levels of quality and customisation. Composed of over 50 papers, "Enterprise Interoperability" ranges from academic research through case studies to industrial and administrative experience of interoperability. The international nature of the authorship continues to broaden. Many of the papers have examples and illustrations calculated to deepen understanding and generate new ideas. A concise reference to the state of the art in software interoperability, "Enterprise Interoperability" will be of great value to engineers and computer scientists working in manufacturing and other process industries and to software engineers and electronic and manufacturing engineers working in the academic environment.
