Advances in Energy System Optimization

Proceedings of the 2nd International Symposium on Energy System Optimization

- Combines perspectives from mathematics, operational research, energy economics and electrical engineering in an interdisciplinary way
- Develops new approaches to integrated energy system and grid modeling designed to solve real-world energy problems efficiently
- Has a clear methodological focus
- Addresses policy-relevant questions
- Combines state-of-the-art quantitative modelling approaches with applied research questions

The papers presented in this open access book address diverse challenges in decarbonizing energy systems, ranging from operational to investment planning problems, from market economics to technical and environmental considerations, from distribution grids to transmission grids, and from theoretical considerations to data provision concerns and applied case studies. While most papers have a clear methodological focus, they address policy-relevant questions at the same time. The target audience therefore includes academics and experts in industry as well as policy makers, who are interested in state-of-the-art quantitative modelling of policy relevant problems in energy systems. The 2nd International Symposium on Energy System Optimization (ISESO 2018) was held at the Karlsruhe Institute of Technology (KIT) under the symposium theme "Bridging the Gap Between Mathematical Modelling and Policy Support" on October 10th and 11th 2018. ISESO 2018 was organized by the KIT, the Heidelberg Institute for Theoretical Studies (HITS), the Heidelberg University, the German Aerospace Center and the University of Stuttgart.
