Graduate/advanced undergraduate textbook

Statistics : Statistical Theory and Methods

Zimmerman, Dale L.

# Linear Model Theory

With Examples and Exercises

- Gives as much emphasis to predictive inference as it does to estimation, which is unique for a book on linear models
- Illustrates every major theorem or concept with at least one special case or example
- Features a wealth of exercises that will benefit students and instructors alike
- Presents important elements of linear model methodology as interludes immediately after the respective theoretical content

This textbook presents a unified and rigorous approach to best linear unbiased estimation and prediction of parameters and random quantities in linear models, as well as other theory upon which much of the statistical methodology associated with linear models is based. The single most unique feature of the book is that each major concept or result is illustrated with one or more concrete examples or special cases. Commonly used methodologies based on the theory are presented in methodological interludes scattered throughout the book, along with a wealth of exercises that will benefit students and instructors alike. Generalized inverses are used throughout, so that the model matrix and various other matrices are not required to have full rank. Considerably more emphasis is given to estimability, partitioned analyses of variance, constrained least squares, effects of model misspecification, and most especially prediction than in many other textbooks on linear models. This book is intended for master and PhD students with a basic grasp of statistical theory, matrix algebra and applied regression analysis, and for instructors of linear models courses. Solutions to the book's exercises are available in the companion volume *Linear Model Theory - Exercises and Solutions* by the same author.
