Advanced Separation Techniques for Polyolefins

Series: Springer Laboratory

- **First comprehensive textbook on high-temperature fractionation techniques**
- **Introduces beginners as well as experienced chromatographers to advanced techniques for the separation and fractionation of polyolefins**
- **Describes a great variety in instrumentation, separation procedures and applications**
- **Provides a complete toolbox to solve both simple and sophisticated separation tasks for polyolefins - the most widely used class of synthetic polymers**

This Springer Laboratory volume introduces the reader to advanced techniques for the separation and fractionation of polyolefins. It includes detailed information on experimental protocols and procedures, addressing the experimental background of different polyolefin fractionation techniques in great detail. The book summarizes important applications in all major fractionation methods with emphasis on multidimensional analytical approaches. It comprises the most powerful modern techniques, such as high temperature size exclusion chromatography (HT-SEC) for molar mass analysis, temperature rising elution fractionation (TREF) and crystallization analysis fractionation (CRYSTAF) for the analysis of chemical composition and branching, high temperature two-dimensional liquid chromatography (HT-2D-LC), solvent and temperature gradient interaction chromatography (SGIC and TGIC) and crystallization elution fractionation (CEF). Beginners as well as experienced chromatographers will benefit from this concise introduction to a great variety in instrumentation, separation procedures and applications. With detailed descriptions of experimental approaches for the analysis of complex polyolefins, the readers are offered a toolbox to solve simple as well as sophisticated separation tasks.
