Energy : Energy Policy, Economics and Management

Giannakidis, G., Labriet, M., Ó Gallachóir, B., Tosato, G. (Eds.)

Informing Energy and Climate Policies Using Energy Systems Models

Insights from Scenario Analysis Increasing the Evidence Base

- Uses methodologies and case studies to demonstrate how energy systems models are used to support energy and climate mitigation policy decision-making at the national, multi-country and global level
- Provides a critical analysis of the rich and varied applications of energy systems models, their underlying methodologies and the policy questions they can address
- Includes diverse global case studies, maximizing reader insights into the role of technology in energy systems models and in providing a basis of evidence for policy decision-making

This book highlights how energy-system models are used to underpin and support energy and climate mitigation policy decisions at national, multi-country and global levels. It brings together, for the first time in one volume, a range of methodological approaches and case studies of good modeling practice on a national and international scale from the IEA-ETSAP energy technology initiative. It provides insights for the reader into the rich and varied applications of energy-system models and the underlying methodologies and policy questions they can address. The book demonstrates how these models are used to answer complex policy questions, including those relating to energy security, climate change mitigation and the optimal allocation of energy resources. It will appeal to energy engineers and technology specialists looking for a rationale for innovation in the field of energy technologies and insights into their evolving costs and benefits. Energy economists will gain an understanding of the key future role of energy technologies and policy makers will learn how energy-system modeling teams can provide unique perspectives on national energy and environment challenges.
