Forecast Error Correction using Dynamic Data Assimilation

Series: Springer Atmospheric Sciences

- Introduces the reader to a new method of dynamic data assimilation called Forward Sensitivity Method (FSM) through theory and application
- The connection between the FSM and the well-known adjoint sensitivity or four-dimensional variational (4D-Var) method is clarified
- The predictability limit of a dynamical model as an outcome of FSM is established
- FSM and 4D-Var assimilation methods are demonstrated through problem solving with low-order dynamical systems and a real-world meteorological problem

This book introduces the reader to a new method of data assimilation with deterministic constraints (exact satisfaction of dynamic constraints)—an optimal assimilation strategy called Forecast Sensitivity Method (FSM), as an alternative to the well-known four-dimensional variational (4D-Var) data assimilation method. 4D-Var works with a forward in time prediction model and a backward in time tangent linear model (TLM). The equivalence of data assimilation via 4D-Var and FSM is proven and problems using low-order dynamics clarify the process of data assimilation by the two methods. The problem of return flow over the Gulf of Mexico that includes upper-air observations and realistic dynamical constraints gives the reader a good idea of how the FSM can be implemented in a real-world situation.
