Pincus, R., Winker, D., Bony, S., Stevens, B. (Eds.), University of Colorado Boulder, Boulder, CO, USA

Shallow Clouds, Water Vapor, Circulation, and Climate Sensitivity

- Provides a comprehensive view of the role of clouds and water vapor in helping control the past, present, and future large-scale circulations, with impacts on climate sensitivity
- Includes thorough assessments of current understanding and future opportunities enabled by field experiments, new and prospective technologies, and emerging synthesis and understanding
- Represents a deep source of cutting-edge information on the topics of convective self-aggregation and low cloud feedbacks
- Presents a unified view of clouds, water vapor, and circulation informed by observational, theoretical, and modeling approaches

This volume presents a series of overview articles arising from a workshop exploring the links among shallow clouds, water vapor, circulation, and climate sensitivity. It provides a state-of-the-art synthesis of understanding about the coupling of clouds and water vapor to the large-scale circulation. The emphasis is on two phenomena, namely the self-aggregation of deep convection and interactions between low clouds and the large-scale environment, with direct links to the sensitivity of climate to radiative perturbations. Each subject is approached using simulations, observations, and synthesizing theory; particular attention is paid to opportunities offered by new remote-sensing technologies, some still prospective. The collection provides a thorough grounding in topics representing one of the World Climate Research Program's Grand Challenges.
