Astronomy on the Personal Computer

- Covers most topics of interest to the practical observer
- Provides practical solutions to a variety of astronomical problems
- Useful as a course book for students
- All programs, written in C++, can be found on the CD-ROM together with the executables running under Windows and Linux

Astronomy on the Personal Computer provides the reader with a thorough introduction to the computation of celestial mechanics, which is of particular significance to astronomical observation. Covering everything from astronomical and computational theory to the construction of rapid and accurate applications programs, this book supplies the necessary knowledge and software solutions for determining and predicting the positions of the Sun, Moon, planets, minor planets and comets, solar eclipses, stellar occultations by the Moon, phases of the Moon and much more. This completely revised edition makes use of the widely implemented programming language C++, and individual applications may be efficiently realized through the use of a powerful module library. The material previously available on an accompanying CD-ROM, now at extras.springer.com, contains, in addition to the complete, fully documented and commented source codes, the executable programs for use with the Windows 98/2000/XP and LINUX operating systems.
