Recent Advances in Computer Vision

Theories and Applications

Series: Studies in Computational Intelligence

- Offers a comprehensive overview of the most advanced theories, methodologies, and modern applications in computer vision
- Presents several new methods and robust algorithms, such as deep learning algorithms
- Covers topics such as object detection and recognition, human actions recognition, face detection and recognition, object segmentation, and shape models

This book presents a collection of high-quality research by leading experts in computer vision and its applications. Each of the 16 chapters can be read independently and discusses the principles of a specific topic, reviews up-to-date techniques, presents outcomes, and highlights the challenges and future directions. As such the book explores the latest trends in fashion creative processes, facial features detection, visual odometry, transfer learning, face recognition, feature description, plankton and scene classification, video face alignment, video searching, and object segmentation. It is intended for postgraduate students, researchers, scholars and developers who are interested in computer vision and connected research disciplines, and is also suitable for senior undergraduate students who are taking advanced courses in related topics. However, it also provides a valuable reference resource for practitioners from industry who want to keep abreast of recent developments in this dynamic, exciting and profitable research field.
