# Precision Measurements to Test the Standard Model and for Explosive Nuclear Astrophysics

Series: Springer Theses

- Nominated as an outstanding PhD thesis by the University of Notre Dame
- Provides an introduction to tests of the Standard Model via nuclear beta decays
- Presents advances in precision testing of the Standard Model
- Presents a Penning trap mass measurement for determining the astrophysical rp process pathway
- Gives an overview of the forthcoming Argonne facility for precision measurements of astrophysical processes

This thesis presents two significant results in the field of precision measurements in low-energy nuclear physics. Firstly, it presents a precise half-life determination of  $^{11}\text{C}$ , leading to the most precise  $ft$ -value for a beta decay transition between mirror nuclides, an important advance in the testing of the electroweak sector of the Standard Model. Secondly, it describes a high-precision mass measurement of  $^{56}\text{Cu}$ , a critical nucleus for determining the path of the astrophysical rapid-proton capture process, performed by the author using the LEBIT Penning trap at the National Superconducting Cyclotron Laboratory. This new measurement resolves discrepancies in previously-reported calculated mass excesses. In addition, the thesis also presents the construction and testing of a radio-frequency quadrupole cooler and buncher that will be part of the future  $N = 126$  factory at Argonne National Laboratory aimed at producing nuclei of interest for the astrophysical rapid-neutron capture process for the first time.
