# New Structures for Physics

- **Only coherent collection of reviews available on this emergent topic Tutorial approach will facilitate the use by graduate students and newcomers to the field Unrivalled comprehensiveness, with close to 1000 pages of material**

This volume provides a series of tutorials on mathematical structures which recently have gained prominence in physics, ranging from quantum foundations, via quantum information, to quantum gravity. These include the theory of monoidal categories and corresponding graphical calculi, Girard's linear logic, Scott domains, lambda calculus and corresponding logics for typing, topos theory, and more general process structures. Most of these structures are very prominent in computer science; the chapters here are tailored towards an audience of physicists.
