# Nanotechnology for Electronic Materials and Devices

Series: Nanostructure Science and Technology

- Covers one of the hottest topic of the new millennium with \$2.4B in funding in the US alone
- Outlines the current status and future trends of micro- and nano-electronics research
- Written by leading experts in each of the research areas
- Serves as an excellent tutorial for graduate students and reference for nano-technology "gurus"
- Provides a broad overview on nanoscience and nanotechnology from chemistry to electronic devices

The high level of attention and interest of the global community to NANO science and technology to a large extent is linked to the GIGAntic challenges for the continuing growth of information technology, which sparked an unprecedented level of interdisciplinary and international cooperation among industrial and academic researchers, companies, IT market rivals, and countries, including former political and military rivals. Microelectronics technologies have reached a new stage in their development: The latest miniaturization of electronic devices is approaching atomic dimensions, interconnect bottlenecks are limiting circuit speeds, new materials are being introduced into microelectronics manufacture at an unprecedented rate, and alternative technologies to mainstream complementary metal-oxide semiconductors (CMOSs) are being considered. The very dynamic stage of science and technology related to the advanced and future electronics and photonics creates a growing gap between the large number of rapid publications and nanotechnology highlights in media on one side and fundamental understanding of underlying phenomena and an adequate evaluation of scientific discoveries and technological innovations on the other side. Writing a tutorial book on fundamentals of science and technology for electronics at this time is almost the same level of challenge as writing a history book during a revolution.
