

Richard Harshaw

The Complete CD Guide to the Universe

Series: The Patrick Moore Practical Astronomy Series

- Large-scale and very detailed finder charts for every part of the sky, from -40° declination to the North Celestial Pole in both normal and mirror image views, let the observer find things just as they appear in his telescope
- Extensive catalog of 14,000 objects, including double stars, nebulae, planetary nebulae, open clusters, globular clusters, galaxies, etc. Plenty to observe for years and years
- Detailed descriptions of the author's observations of hundreds of objects, and observing reports from various amateurs are included. Readers can have confidence that these objects really have been observed with an amateur telescope instrument of 8 inches or larger
- Extensive historical data on important objects in t

This is without doubt the largest and most comprehensive atlas of the universe ever created for amateur astronomers. It is the first major observing guide for amateurs since Burnham's Celestial Handbook. With finder charts of large-scale and unprecedented detail, in both normal and mirror-image views (for users of the ubiquitous Meade and Celestron Schmidt-Cassegrain telescope ranges), and an extensive list of 14,000 objects, it will provide a detailed observing guide for almost any practical amateur astronomer, up to the most advanced. Spanning some 3,000 pages, this is a project that is possible only with Springer Extra Materials, <http://extras.springer.com>. The atlas covers the whole range of objects viewable by amateur astronomers with 8- to 11-inch telescopes, from latitude approx $+40$ degrees. The projected total number of objects is (currently) 13,238, compared with Burnham's approximately 5,000 double stars (in three volumes). This is much more than just a catalog of objects. As planned, the atlas will have about 270 double star images and sketches, and 590 or so deep-sky images and sketches. Comparisons with other atlases are invidious, but Tirion's atlas and Uranometria, for example, don't go as deep in magnitude and the scale is unsuitable for "star hopping" in the eyepiece—where the action REALLY takes place.
