Business and Management : Operation Research/Decision Theory

Chhajed, Dilip, Lowe, Timothy J. (Eds.)

Building Intuition

Insights from Basic Operations Management Models and Principles

- The book will equip students and managers with an intuitive understanding of basic quantitative models that can be used in making every day business decisions without using any extensive quantitative data or methods
- Some of the very biggest names in the Management Science field have developed and carefully written these chapters on the field's basic models
- Each chapter has been structured in a similar format, and carefully written and edited to ensure the material is especially well-motivated and clearly accessible
- In addition to building intuition and generating management insights, the book explains why intuition either fails or succeeds

One of the primary purposes of any model is to build intuition and generate insights. Typically, a model is developed to be able to better understand phenomena that are otherwise difficult to comprehend. Models can also help in verifying the correctness of an intuition or judgment. In spite of the fact that many educators and practitioners recognize the intuition-building power of simple models, this is the first book in the field that uses the power of the basic models and principles to provide students and managers with an "intuitive understanding" of operations management. Building Intuition: Insights From Basic Operations Management Models and Principles touches on nine fundamental models and principles, and outlines the key insights behind each one. To ensure that the volume is accurate, authoritative, accessible and well-written, the chapters are developed by leading experts in each chapter area and written with the students and managers in mind. The book's primary purpose is to motivate and to enable readers to develop insights with respect to a number of models that are central to the study and practice of operations management.
