**Logic and Responsibility in the Computer Age**

- **\* Discusses the emergence of computers as an elemental force in our modern society. \* Written by a powerful tandem of a scientist and philosopher we see a balanced viewpoint of the issues addressed. \* This thoughtful analysis provides readers with a much better understanding of the limitations of new technologies, along with propositions for better use and implementation of them within a cultural context.**

Computer technology has become a mirror of what we are and a screen on which we project both our hopes and our fears for the way the world is changing. Earlier in this century, particularly in the post-World War II era of unprecedented growth and prosperity, the social contract between citizens and scientists/engineers was epitomized by the line Ronald Reagan promoted as spokesman for General Electric: "Progress is our most important product." In more recent decades, post-Chernobyl, post-Challenger, post-Bhopal, post-Microsoft, the social contract has undergone a transformation. More people are uncertain, fearful, and downright opposed to the notion that more technology guarantees a better life. What is a "better life"? Who benefits and who loses when new technologies change the way we live, work, learn, and play? Who has a say in the way technologies are designed and deployed? Where are we going, are we sure we want to go there, and who has the power to do anything about it? From the early days of the railroads, into the era of electrification, through the McLuhan age, much of the discourse about technology has been hype, utopianism, and what some historians have called "the rhetoric of the technological sublime." We have discovered, however, that not all people benefit economically or politically from technological change.
