Statistics : Statistics and Computing / Statistics Programs

Gentle, James E.

# Elements of Computational Statistics

In recent years developments in statistics have to a great extent gone hand in hand with developments in computing. Indeed, many of the recent advances in statistics have been dependent on advances in computer science and technology. Many of the currently interesting statistical methods are computationally intensive, either because they require very large numbers of numerical computations or because they depend on visualization of many projections of the data. The class of statistical methods characterized by computational intensity and the supporting theory for such methods constitute a discipline called "computational statistics". (Here, I am following Wegman, 1988, and distinguishing "computational statistics" from "statistical computing", which we take to mean "computational methods, including numerical analysis, for statisticians".) The computationally-intensive methods of modern statistics rely heavily on the developments in statistical computing and numerical analysis generally. Computational statistics shares two hallmarks with other "computational" sciences, such as computational physics, computational biology, and so on. One is a characteristic of the methodology: it is computationally intensive. The other is the nature of the tools of discovery. Tools of the scientific method have generally been logical deduction (theory) and observation (experimentation). The computer, used to explore large numbers of scenarios, constitutes a new type of tool. Use of the computer to simulate alternatives and to present the research worker with information about these alternatives is a characteristic of the computational sciences. In some ways this usage is akin to experimentation. The observations, however, are generated from an assumed model, and those simulated data are used to evaluate and study the model.
