Boris Mirkin

Core Concepts in Data Analysis: Summarization, Correlation and Visualization

Series: Undergraduate Topics in Computer Science

- Provides an in-depth understanding of a few basic techniques in data analysis rather than covering the broad spectrum of approaches developed to date.
- Explores methodical innovations of summarization and correlation techniques in a cognitive way.
- Includes worked examples, case studies, projects and questions, ideal for class and self-study.

Core Concepts in Data Analysis: Summarization, Correlation and Visualization provides in-depth descriptions of those data analysis approaches that either summarize data (principal component analysis and clustering, including hierarchical and network clustering) or correlate different aspects of data (decision trees, linear rules, neuron networks, and Bayes rule). Boris Mirkin takes an unconventional approach and introduces the concept of multivariate data summarization as a counterpart to conventional machine learning prediction schemes, utilizing techniques from statistics, data analysis, data mining, machine learning, computational intelligence, and information retrieval. Innovations following from his in-depth analysis of the models underlying summarization techniques are introduced, and applied to challenging issues such as the number of clusters, mixed scale data standardization, interpretation of the solutions, as well as relations between seemingly unrelated concepts: goodness-of-fit functions for classification trees and data standardization, spectral clustering and additive clustering, correlation and visualization of contingency data.
