# Bacteriophages

Methods and Protocols, Volume IV

Series: Methods in Molecular Biology

- Includes cutting-edge methods and protocols
- Provides step-by-step detail essential for reproducible results
- Contains key notes and implementation advice from the experts

This book expands on the previous volumes with new chapters focusing on functional characterization of phage and their proteins, and on the development of phage therapy by outlining novel models. The chapters in this book cover molecular topics such as PhageFISH for monitoring phage infections at single cell level; the analysis of phage-host protein-protein interactions using Strep-tag® II purifications; and also application driven chapters including 'duckweed (*Lemna minor*) and alfalfa (*Medicago sativa*) as bacterial infection model systems'. Written in the highly successful Methods in Molecular Biology series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Innovative and thorough, *Bacteriophages: Methods and Protocols, Volume IV* is a valuable resource for both established and novice phage scientists.
