Handbook of Materials Structures, Properties, Processing and Performance

- Documents and illustrates materials innovations, applications, processing, and synthesis, including the mimicking of biological materials and materials systems
- Integrates materials engineering, physics, materials and crystal chemistry, biological materials and innovations in materials development, processing/fabrication, and relevant applications and functionalities
- Features a history of materials and of the evolution of fundamentals as they came to be applied contemporary materials, smart materials, and materials systems
- Includes extensive graphics, illustrations, and reference system linking concepts and original sources

This extensive knowledge base provides a coherent description of advanced topics in materials science and engineering with an interdisciplinary/multidisciplinary approach. The book incorporates a historical account of critical developments and the evolution of materials fundamentals, providing an important perspective for materials innovations, including advances in processing, selection, characterization, and service life prediction. It includes the perspectives of materials chemistry, materials physics, engineering design, and biological materials as these relate to crystals, crystal defects, and natural and biological materials hierarchies, from the atomic and molecular to the macroscopic, and emphasizing natural and man-made composites. This expansive presentation of topics explores interrelationships among properties, processing, and synthesis (historic and contemporary).
