Denise Phillips, Sharon Kingsland (Eds.)

New Perspectives on the History of Life Sciences and Agriculture

Series: Archimedes

- Offers an exceptional comparative perspective on life sciences and agriculture
- Explains the emergence and transformation of life science disciplines
- Underscores the connection between life sciences, economy and politics
- Helps to link scholarly communities in the history of life science and history of agriculture
- Presents a new perspective on the role of "founding fathers" in science such as Humboldt, Mendel

This volume explores problems in the history of science at the intersection of life sciences and agriculture, from the mid-eighteenth to the mid-twentieth century. Taking a comparative national perspective, the book examines agricultural practices in a broad sense, including the practices and disciplines devoted to land management, forestry, soil science, and the improvement and management of crops and livestock. The life sciences considered include genetics, microbiology, ecology, entomology, forestry, and deal with US, European, Russian, Japanese, Indonesian, Chinese contexts. The book shows that the investigation of the border zone of life sciences and agriculture raises many interesting questions about how science develops. In particular it challenges one to re-examine and take seriously the intimate connection between scientific development and the practical goals of managing and improving – perhaps even recreating – the living world to serve human ends. Without close attention to this zone it is not possible to understand the emergence of new disciplines and transformation of old disciplines, to evaluate the role and impact of such major figures of science as Humboldt and Mendel, or to appreciate how much of the history of modern biology has been driven by national ambitions and imperialist expansion in competition with rival nations.
