

Manuel Osvaldo Cáceres

# Non-equilibrium Statistical Physics with Application to Disordered Systems

- Fills the gap in the literature for an introductory and didactical book on stochastic processes with different applications in physics and biology
- Presents a student-friendly text on non-equilibrium statistical mechanics and non-stationary stochastic processes
- Provides a concise and didactical text addressing the Fluctuation-Dissipation theorem in classical and quantum systems from first principles
- Includes, in each chapter, numerous problems and their solutions

This textbook is the result of the enhancement of several courses on non-equilibrium statistics, stochastic processes, stochastic differential equations, anomalous diffusion and disorder. The target audience includes students of physics, mathematics, biology, chemistry, and engineering at undergraduate and graduate level with a grasp of the basic elements of mathematics and physics of the fourth year of a typical undergraduate course. The little-known physical and mathematical concepts are described in sections and specific exercises throughout the text, as well as in appendices. Physical-mathematical motivation is the main driving force for the development of this text. It presents the academic topics of probability theory and stochastic processes as well as new educational aspects in the presentation of non-equilibrium statistical theory and stochastic differential equations. In particular it discusses the problem of irreversibility in that context and the dynamics of Fokker-Planck. An introduction on fluctuations around metastable and unstable points are given. It also describes relaxation theory of non-stationary Markov periodic in time systems.

1st ed. 2017, XXIV, 556 p. 51 illus.
