Computer Science : Data Mining and Knowledge Discovery

Aggarwal, Charu C., IBM T. J. Watson Research Center, Yorktown Heights, NY, USA

Machine Learning for Text

- The first textbook to cover machine learning of text in a holistic way, which includes aspects of mining, language modeling, and deep learning
- Includes many examples to simplify exposition and facilitate in learning. Semantically understandable illustrations are provided, so that they can be used in classroom teaching
- Provides comprehensive coverage of this field. The depth and breadth of coverage
- is unique to this textbook

Text analytics is a field that lies on the interface of information retrieval, machine learning, and natural language processing, and this textbook carefully covers a coherently organized framework drawn from these intersecting topics. The chapters of this textbook is organized into three categories: - Basic algorithms: Chapters 1 through 7 discuss the classical algorithms for machine learning from text such as preprocessing, similarity computation, topic modeling, matrix factorization, clustering, classification, regression, and ensemble analysis. - Domain-sensitive mining: Chapters 8 and 9 discuss the learning methods from text when combined with different domains such as multimedia and the Web. The problem of information retrieval and Web search is also discussed in the context of its relationship with ranking and machine learning methods. - Sequence-centric mining: Chapters 10 through 14 discuss various sequence-centric and natural language applications, such as feature engineering, neural language models, deep learning, text summarization, information extraction, opinion mining, text segmentation, and event detection. This textbook covers machine learning topics for text in detail. Since the coverage is extensive, multiple courses can be offered from the same book, depending on course level. Even though the presentation is text-centric, Chapters 3 to 7 cover machine learning algorithms that are often used in domains beyond text data. Therefore, the book can be used to offer courses not just in text analytics but also from the broader perspective of machine learning (with text as a backdrop).
