Engineering : Computational Intelligence

Bessis, N., Xhafa, F., Varvarigou, D., Hill, R., Li, M. (Eds.)

Internet of Things and Inter-cooperative Computational Technologies for Collective Intelligence

- Discusses the theories, practices and concepts of utilising inter-operable and inter-cooperative next generation computational technologies
- Includes mobile and the emerging e-infrastructures of Web 2.0, SOA, P2P, Grids and Clouds
- Written by leading experts in the field

Over the past two decades, we have witnessed unprecedented innovations in the development of miniaturized electromechanical devices and low-power wireless communication making practical the embedding of networked computational devices into a rapidly widening range of material entities. This trend has enabled the coupling of physical objects and digital information into cyber-physical systems and it is widely expected to revolutionize the way resource computational consumption and provision will occur. Specifically, one of the core ingredients of this vision, the so-called Internet of Things (IoT), demands the provision of networked services to support interaction between conventional IT systems with both physical and artificial objects. In this way, IoT is seen as a combination of several emerging technologies, which enables the transformation of everyday objects into smart objects. It is also perceived as a paradigm that connects real world with digital world. The focus of this book is exactly on the novel collective and computational intelligence technologies that will be required to achieve this goal.
