Economics : Economic Theory/Quantitative Economics/Mathematical Methods

Flores, Carlos A., Chen, Xuan, California Polytechnic State University, San Luis Obispo, CA, USA

Average Treatment Effect Bounds with an Instrumental Variable: Theory and Practice

- Provides a comprehensive survey of recently developed approaches for partial identification of average treatment effects in program evaluation
- Compares the identification power of different sets of assumptions employed by various partial identification approaches in program evaluation
- Discusses implementation of the bounds in practice, including interpretation and assessment of the assumptions, as well as estimation and inference
- Illustrates the use of bounds on treatment effects with instrumental variables in program evaluation by surveying recent applications
- Bridges the gap between the theory of the econometric derivation of bounds on treatment effects with instrumental variables in the program evaluation

This book reviews recent approaches for partial identification of average treatment effects with instrumental variables in the program evaluation literature, including Manski's bounds, bounds based on threshold crossing models, and bounds based on the Local Average Treatment Effect (LATE) framework. It compares these bounds across different sets of assumptions, surveys relevant methods to assess the validity of these assumptions, and discusses estimation and inference methods for the bounds. The book also reviews some empirical applications employing bounds in the program evaluation literature. It aims to bridge the gap between the econometric theory on which the different bounds are based and their empirical application to program evaluation.
