Environmental Concerns and Sustainable Development

Volume 2: Biodiversity, Soil and Waste Management

- Covers major topics in soil reclamation and waste management and presents a range of approaches to biodiversity conservation
- Provides insights into a broad range of major environmental concerns, which will be beneficial for students and researchers interested in the global environmental crisis and approaches to sustainable development
- Involves integrated approaches to understanding the importance of environmental management systems and policy measures that lead to improved environmental performance

The current global environmental crisis is primarily the result of non-standardized parameters for environmental regulation, and is impacting e.g. clean air, safe drinking water and the quality of food, particularly in developing nations. Due to their poor/lax execution of EIA protocols, newly developing countries are preferred destinations for establishing pollution-emitting industries, which results in the degradation and depletion of their natural resources. Lack of environmental policy intervention is another major incentive to base "dirty" industries in these nations. In order to ensure sustainable development, the highest-priority issues include the monitoring and eradication of environmental problems stemming from economic development; virtually every form of economic development primarily results in the loss of forests and thus biodiversity, followed by declining air quality and the contamination of natural resources. Sustainable development ensures responsible interactions with the environment, so as to minimize the depletion or degradation of natural resources and preserve environmental quality.
